**REGULAR**

Q. 1	Attempt any THREE of the following.	[15]	Course Outcome	Knowledge Level
(a)	<p>A robotics lab is studying the motion of a robotic arm in 3D space. The position vectors of the arm's endpoint are recorded as points in <math>\mathbb{R}^3</math>. Due to a mechanical constraint, the arm can only reach positions <math>p = [x, y, z]^T</math> that satisfy the linear relationship: <math>2x + y - z = 0</math>. Let <math>S</math> be the set of all position vectors in <math>\mathbb{R}^3</math> that satisfy this constraint.</p> <p>(i) Prove that <math>S</math> is a subspace of <math>\mathbb{R}^3</math> by verifying all three subspace conditions.</p> <p>(ii) Find two linearly independent vectors that span <math>S</math>, and verify they form a basis for <math>S</math>.</p> <p>(iii) The robotic arm is currently at position <math>[3, -2, 4]^T</math>. Determine whether this position is reachable under the given constraint. Explain mathematically.</p>		CO1	L1
(b)	<p>A population ecology study tracks two competing species: rabbits (R) and foxes (F) in a controlled ecosystem. The population dynamics from one month to the next are modelled by the linear transformation represented by the matrix:</p> $A = \begin{bmatrix} 1.2 & -0.2 \\ 0.3 & 0.7 \end{bmatrix}$ <p>where the population vector <math>v = [r, f]^T</math> represents the number of rabbits and foxes (in hundreds), and the next month's population is given by <math>v' = Av</math>.</p> <p>(i) Find the characteristic equation of matrix <math>A</math>.</p> <p>(ii) Calculate both eigenvalues of <math>A</math>.</p> <p>(iii) For each eigenvalue found, determine the corresponding eigenvector.</p> <p>(iv) Interpret the biological significance: If the initial population is an eigenvector corresponding to the larger eigenvalue, what does this tell us about the long-term behaviour of the ecosystem? Explain in terms of population growth or decline.</p>		CO2	L2
(c)	<p>If <math>v_1 = (1, 2, 3)</math> and <math>v_2 = (4, 5, 6)</math>, check if these vectors are linearly independent.</p>		CO1	L1
(d)	<p>Let <math>T: \mathbb{R}^2 \rightarrow \mathbb{R}^2, T(x, y) = (2x + 3y, x + 3y)</math>. Find the matrix representation of <math>T</math>.</p>		CO1	L1

	<p>(e) A tiny <math>2 \times 2</math> image patch has grayscale intensity values <math>A = \begin{bmatrix} 2 &amp; 1 \\ 1 &amp; 2 \end{bmatrix}</math>. Each entry represents the brightness of a pixel (0 = black, larger values = brighter).</p> <p>(i) Compute the singular values of <math>A</math>.</p> <p>(ii) Compute the dominant left singular vector <math>u_1</math>.</p> <p>(iii) Write the rank-1 SVD approximation <math>A_1 = \sigma_1 u_1 v_1^T</math>.</p> <p>(iv) Interpret what the dominant singular value says about the main pattern in this image patch. (e.g. whether the image is mostly uniform or if a particular pattern dominates).</p>		CO2	L2																											
Q. 2	Attempt any THREE of the following.	[15]	Course Outcome	Knowledge Level																											
	<p>(a) A machine learning engineer is developing a predictive model for battery life in autonomous drones. She collects data on 8 drone flights and records two variables:</p> <ul style="list-style-type: none"> <li>• Flight Time (<math>x</math>): Duration of flight in minutes</li> <li>• Battery Temperature (<math>y</math>): Average battery temperature in <math>^{\circ}\text{C}</math> during flight</li> </ul> <p>The data collected is shown below:</p> <table border="1" data-bbox="242 804 970 972"> <thead> <tr> <th>Flight</th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> <th>6</th> <th>7</th> <th>8</th> </tr> </thead> <tbody> <tr> <td>Flight Time (<math>x</math>)</td> <td>15</td> <td>20</td> <td>25</td> <td>30</td> <td>35</td> <td>40</td> <td>45</td> <td>50</td> </tr> <tr> <td>Battery Temp (<math>y</math>)</td> <td>35</td> <td>38</td> <td>42</td> <td>45</td> <td>48</td> <td>52</td> <td>55</td> <td>58</td> </tr> </tbody> </table> <p>Given the following computed values:</p> <p><math>\Sigma x = 260, \Sigma y = 373, \Sigma x^2 = 9500, \Sigma y^2 = 17855,</math></p> <p><math>\Sigma xy = 12820, n = 8</math></p> <p>(i) Calculate the Pearson correlation coefficient (<math>r</math>) between Flight Time and Battery Temperature.</p> <p>(ii) Interpret the correlation coefficient value obtained. What does it indicate about the relationship between flight time and battery temperature?</p> <p>(iii) Using the least squares method, find the simple linear regression equation <math>\hat{y} = a + bx</math>.</p>	Flight	1	2	3	4	5	6	7	8	Flight Time ( $x$ )	15	20	25	30	35	40	45	50	Battery Temp ( $y$ )	35	38	42	45	48	52	55	58		CO3, CO4	L3
Flight	1	2	3	4	5	6	7	8																							
Flight Time ( $x$ )	15	20	25	30	35	40	45	50																							
Battery Temp ( $y$ )	35	38	42	45	48	52	55	58																							
	<p>(b) A cybersecurity team is developing an AI-based email spam detection system. They train a logistic regression model to classify emails as spam (<math>y = 1</math>) or legitimate (<math>y = 0</math>) based on the number of suspicious keywords found in the email.</p> <p>The trained logistic regression model has the following equation:</p> $\log \frac{p}{1-p} = -2.5 + 0.8x$ <p>where:</p> <ul style="list-style-type: none"> <li>• <math>p</math> = probability that an email is spam</li> <li>• <math>x</math> = number of suspicious keywords in the email</li> <li>• <math>\log</math> denotes the natural logarithm (<math>\ln</math>)</li> </ul> <p>(i) Write down the logistic regression equation in the form <math>p = \frac{1}{1+e^{-z}}</math>. What is the expression for <math>z</math> in this model?</p>		CO4	L5																											

	<p>(ii) Calculate the probability that an email is spam when it contains:</p> <ul style="list-style-type: none"> <li><math>x = 2</math> suspicious keywords</li> <li><math>x = 5</math> suspicious keywords</li> </ul> <p>(iii) Calculate and interpret the odds ratio when the number of suspicious keywords increases from 2 to 3.</p> <p>(iv) The cybersecurity team sets a classification threshold at <math>p = 0.5</math>. Determine the minimum number of suspicious keywords required for an email to be classified as spam. Show your calculation.</p>																																											
(c)	<p>If <math>X \sim N(\mu = 25, \sigma = 10)</math>, find</p> <p>(i) <math>P(X \geq 15)</math>    (ii) <math>P(25 &lt; X &lt; 35)</math>    (iii) <math>P(15 &lt; X &lt; 35)</math></p>		CO4	L5																																								
(d)	<p>A senior citizen receives on average 2.5 telephone calls during his afternoon nap period 1400-1405 hrs. Find probability that on a certain day, he receives</p> <p>(i) no telephone calls.</p> <p>(ii) exactly four calls during the same period.</p>		CO4	L5																																								
(e)	<p>An autonomous robot navigation system uses a Naive Bayes classifier to predict whether a detected object is an Obstacle or Safe Path based on sensor readings from three different sensors. Class Variable: <math>C \in \{Obstacle, Safe Path\}</math></p> <table border="1"> <thead> <tr> <th>Feature</th> <th>Description</th> <th>Possible Values</th> </tr> </thead> <tbody> <tr> <td><math>F_1</math></td> <td>Infrared sensor reading</td> <td>High, Low</td> </tr> <tr> <td><math>F_2</math></td> <td>Ultrasonic distance</td> <td>Near, Far</td> </tr> <tr> <td><math>F_3</math></td> <td>Camera edge detection</td> <td>Detected, Not Detected</td> </tr> </tbody> </table> <p>Given Probabilities: Class Priors: <math>P(Obstacle) = 0.4</math>    <math>P(Safe Path) = 0.6</math></p> <p>Conditional Probabilities (Likelihoods):</p> <table border="1"> <thead> <tr> <th>Feature</th> <th>Value</th> <th><math>P(Value Obstacle)</math></th> <th><math>P(Value Safe Path)</math></th> </tr> </thead> <tbody> <tr> <td><math>F_1</math></td> <td>High</td> <td>0.85</td> <td>0.15</td> </tr> <tr> <td><math>F_1</math></td> <td>Low</td> <td>0.15</td> <td>0.85</td> </tr> <tr> <td><math>F_2</math></td> <td>Near</td> <td>0.90</td> <td>0.20</td> </tr> <tr> <td><math>F_2</math></td> <td>Far</td> <td>0.10</td> <td>0.80</td> </tr> <tr> <td><math>F_3</math></td> <td>Detected</td> <td>0.75</td> <td>0.30</td> </tr> <tr> <td><math>F_3</math></td> <td>Not detected</td> <td>0.25</td> <td>0.70</td> </tr> </tbody> </table> <p>The robot's sensors report the following readings:</p> <ul style="list-style-type: none"> <li>Infrared sensor: High</li> <li>Ultrasonic distance: Near</li> <li>Camera edge detection: Detected</li> </ul> <p>(i) Calculate the unnormalized posterior probability for the class "Obstacle" given the sensor readings.</p> <p>(ii) Calculate the unnormalized posterior probability for the class "Safe Path" given the sensor readings.</p> <p>(iii) Normalize both probabilities and determine which class the robot should predict. Calculate the final posterior probabilities.</p>	Feature	Description	Possible Values	$F_1$	Infrared sensor reading	High, Low	$F_2$	Ultrasonic distance	Near, Far	$F_3$	Camera edge detection	Detected, Not Detected	Feature	Value	$P(Value Obstacle)$	$P(Value Safe Path)$	$F_1$	High	0.85	0.15	$F_1$	Low	0.15	0.85	$F_2$	Near	0.90	0.20	$F_2$	Far	0.10	0.80	$F_3$	Detected	0.75	0.30	$F_3$	Not detected	0.25	0.70		CO6	L6
